

# VOODOO LAB

## GCX Worksheet

### Noise Gate, Channel A/B

This rig places a single stompbox in front of two different preamps. Note that the Quad Preamp is running into both channels of the DBX compressor.

Loop 2 is wired so that it can select one of the two different channels/settings on the compressor.

The rest of the GCX is used to select channels and various other functions on both the Studio Preamp and Quad Preamp.
